

Now that the calendar is changing to June, we will begin monitoring for the possibility of PJM peak load events. Going forward, we will send a report on Monday morning to provide an outlook for the upcoming week. As a possible peak day approaches, additional reports will be sent to keep you informed of the likelihood of setting one of the 5 peak load days. This will normally occur in the morning and then early afternoon ahead of the peak.

Tomorrow, June 1st, has a low probability of being one of the 5 summer peaks. Load is forecasted to be in the low 120,000 MW range and the initial control target for a possible event is 133,000 MWs.

Real Time PJM RTO Total load can be tracked here

Annual capacity costs are set by your usage contribution to the peak hour during the 5 peak days from June through September, multiplied by the auction clearing price. Any usage reduction during these hours can reduce your costs starting in June of the following year. As the PJM forecasted usage approaches or exceeds the Estimated Control Target, you may want to reduce your organization's expected usage.

The capacity costs you pay go to power generators who can guarantee availability. IGS Energy sets an estimated control target based on the previous summer's peaks and will adjust the target as the current summer progresses. Annual clearing prices are determined by PJM through auctions. More information about PJM can be found at www.PJM.com
