Subject: PJM Peak Report for 6-18-2018
Attachments: 06.18.18 PJM-PLC Forecast.pdf

Today has a high probability of being a peak day. Peak load for PJM is forecasted to be 147,000 MW, which is higher than last year's peaks. Heat indexes in much of PJM will top 100 degrees and there is not much chance of rain to reduce the forecasted peak.

The forecast for Tuesday has moderated and it is currently below the control target.

An updated report will be issued later today ahead of the peak to update the forecasts.

Real Time PJM RTO Total load can be tracked here https://dataviewer.pjm.com/dataviewer/pages/public/load.jsf

Annual capacity costs are set by your usage contribution to the peak hour during the 5 peak days from June through September, multiplied by the auction clearing price. Any usage reduction during these hours can reduce your costs starting in June of the following year. As the PJM forecasted usage approaches or exceeds the Estimated Control Target, you may want to reduce your organization's expected usage.

The capacity costs you pay go to power generators who can guarantee availability. IGS Energy sets an estimated control target based on the previous summer's peaks and will adjust the target as the current summer progresses. Annual clearing prices are determined by PJM through auctions. More information about PJM can be found at www.PJM.com
