**Subject:** PJM Peak Report for 6-3-2019  
**Attachments:** 06.03.19 PJM-PLC Forecast.pdf

Since June has arrived, we will begin monitoring for the possibility of PJM peak load days. Going forward, we will send a report on Monday morning to provide an outlook for the upcoming week. As a possible peak day approaches, additional reports will be sent to keep you informed of the likelihood of setting one of the 5 peak load days. These will normally be sent in the morning and then early afternoon ahead of the peak.

### This Week

Cool temperatures are forecasted thru the middle of June so there is a low probability of reaching our initial control target of 137,000 MWs of peak demand. This is a fairly low starting point for peak demand, but there is the potential for a cooler El Nino summer in the PJM footprint and expanding residential solar which helps reduce the measured peak demand. This low target would have captured the peaks in the cooler summers of 2014 and 2015.

Real Time PJM RTO Total load can be tracked here <https://dataviewer.pjm.com/dataviewer/pages/public/load.jsf>. Select 'PJM RTO Total' from the drop down to view the total PJM demand for the day.

Annual capacity costs are set by your usage contribution to the peak hour during the 5 peak days from June through September, multiplied by the auction clearing price. Any usage reduction during these hours can reduce your costs starting in June of the following year. As the PJM forecasted usage approaches or exceeds the Estimated Control Target, you may want to reduce your organization's expected usage.

The capacity costs you pay go to power generators who can guarantee availability. IGS Energy sets an estimated control target based on the previous summer's peaks and will adjust the target as the current summer progresses. Annual clearing prices are determined by PJM through auctions. More information about PJM can be found at [www.PJM.com](http://www.PJM.com)
